INSTRUCTIONS FOR USE
This Medical Policy provides assistance in interpreting UnitedHealthcare benefit plans. When deciding coverage, the enrollee specific document must be referenced. The terms of an enrollee’s document (e.g., Certificate of Coverage (COC) or Summary Plan Description (SPD) and Medicaid State Contracts) may differ greatly from the standard benefit plans upon which this Medical Policy is based. In the event of a conflict, the enrollee’s specific benefit document supersedes this Medical Policy. All reviewers must first identify enrollee eligibility, any federal or state regulatory requirements and the enrollee specific plan benefit coverage prior to use of this Medical Policy. Other Policies and Coverage Determination Guidelines may apply. UnitedHealthcare reserves the right, in its sole discretion, to modify its Policies and Guidelines as necessary. This Medical Policy is provided for informational purposes. It does not constitute medical advice.

UnitedHealthcare may also use tools developed by third parties, such as the MCG™ Care Guidelines, to assist us in administering health benefits. The MCG™ Care Guidelines are intended to be used in connection with the independent professional medical judgment of a qualified health care provider and do not constitute the practice of medicine or medical advice.

BENEFIT CONSIDERATIONS
Essential Health Benefits for Individual and Small Group: For plan years beginning on or after January 1, 2014, the Affordable Care Act of 2010 (ACA) requires fully insured non-grandfathered individual and small group plans (inside and outside of Exchanges) to provide coverage for ten categories of Essential Health Benefits (“EHBs”). Large group plans (both self-funded and fully insured), and small group ASO plans, are not subject to the requirement to offer coverage for EHBs. However, if such plans choose to provide coverage for benefits which are deemed EHBs (such as maternity benefits), the ACA requires all dollar limits on those benefits to be removed on all Grandfathered and Non-Grandfathered plans. The determination of which benefits constitute EHBs is made on a state by state basis. As such, when using this guideline, it is important to refer to the enrollee’s specific plan document to determine benefit coverage.
COVERAGE RATIONALE

Computerized dynamic posturography (CDP) testing, also called balance board testing or equilibrium platform testing (EPT) is unproven and not medically necessary for evaluating balance disorders.

The overall quality of the evidence on the efficacy of computerized dynamic posturography (CDP) for evaluation of vestibular disorders is weak. There is a lack of well-designed, prospective, randomized controlled trials using blind assessment to demonstrate the diagnostic utility of CDP compared with standard tests. There are no reliable data demonstrating any consistent, beneficial effect of CDP testing on patient outcomes.

APPLICABLE CODES

The Current Procedural Terminology (CPT®) codes and Healthcare Common Procedure Coding System (HCPCS) codes listed in this policy are for reference purposes only. Listing of a service code in this policy does not imply that the service described by this code is a covered or non-covered health service. Coverage is determined by the enrollee specific benefit document and applicable laws that may require coverage for a specific service. The inclusion of a code does not imply any right to reimbursement or guarantee claims payment. Other policies and coverage determination guidelines may apply. This list of codes may not be all inclusive.

Coding Clarification
Computerized dynamic posturography is unproven and not medically necessary for all diagnosis codes.

DESCRIPTION OF SERVICES

Computerized dynamic posturography (CDP), also known as moving platform posturography or dynamic posturography uses a platform device for evaluating a patient’s ability to maintain balance. CDP has been used to measure a patient's ability to maintain balance under varying conditions when the usual cues that one relies upon to remain upright, vision, proprioception, and vestibular function, are manipulated. The goal of testing is to isolate vestibular symptoms to a specific cause that can often be treated. (Hayes, 2008)

Standard diagnostic tests include electronystagmography and rotational chair tests, which evaluate eye movements in response to a number of different stimuli including the position and rotation of the head.

CLINICAL EVIDENCE

The clinical evidence was reviewed on February 5, 2014 with no additional information identified that would change the unproven and not medically necessary conclusions.

The evidence in the published peer-reviewed medical literature examining the safety and effectiveness of CDP includes older studies, some poorly designed, with varying results (Morgan, et al., 2002; El Kashian, et al., 1998; Di Fabio, 1996; Di Fabio, 1995). A systematic review by Piirtola and Era (2006) evaluated prospective studies (n=9 studies) and reported that measures related to dynamic posturography (i.e., moving platforms) were not found to be predictive of falls among elderly populations. It was found that while certain aspects of force platform data may have predictive value for subsequent falls, the small number of available studies made it difficult to draw conclusions.
Additional evidence evaluating the use of CDP is primarily in the form of prospective and retrospective case series and validation studies with patient populations ranging from 26–216 (Ebersbach, et al., 2011; Mockford, et al., 2010; Gouveris, et al., 2007; Mbongo, et al., 2005; Sataloff, et al., 2005; Soto, et al., 2004; Artuso, et al., 2004; Amin; et al., 2002). Studies have included patients with a various disorders including vertigo, vestibular schwannoma, and Ménière's disease. Overall, small sample sizes and poor study design have limited the generalizability of these study results. The data have not reliably demonstrated any beneficial effects of CDP evaluation on patient outcomes.

Insufficient evidence exists in the form of well-designed, large-population, prospective, randomized, controlled trials to draw definitive conclusions regarding the accuracy of computerized dynamic posturography (CDP) and the impact of CDP testing results on health outcomes. The diagnostic utility of CDP has not been demonstrated. Qualitative data provided by CDP testing serves as a supplement to established alternatives. (Hayes, 2008)

**Professional Societies**

**American Academy of Otolaryngology - Head and Neck Surgery (AAO-HNS)**

AAO-HNS recognizes that the following tests or treatments are medically indicated and appropriate in the evaluation or treatment of persons with suspected balance or dizziness disorders:

- rotational chair step velocity testing
- harmonic acceleration testing
- vestibular rehabilitation therapy including the use of therapy devices
- dynamic platform posturography

*This statement is not part of a formal guideline and is not supported by clinical evidence. (AAO-HNS, 2007)*

**U.S. FOOD AND DRUG ADMINISTRATION (FDA)**

Devices for testing vestibular dysfunction are captured in the FDA 510(k) database under Product Code LXV (Vestibular Analysis Apparatus), IKN (Electromyograph, Diagnostic) and/or Product Code KHX (Force-Measuring Platforms). Note that devices in product categories LXV and KHX are Class I, 510(k) exempt devices. Devices in product category IKN are class II devices which are also 510(k) exempt. Although many manufacturers have voluntarily submitted product information via the 510(k) process, it is not a requirement. All manufacturers are, however, required to register their establishment and submit a “Device Listing” form; these records can be viewed in the Device Listing Database. See the following Web sites for more information:

Another device mentioned in the literature is the Balance Quest™ (also known as System 2000; Vortex) (Micromedical Technologies Inc.), which is listed as an unclassified device. See the following Web sites for more information:

Medicare does not have a National Coverage Determination (NCD) for Computerized Dynamic Posturography. Local Coverage Determinations (LCDs) do exist. Refer to the LCDs for Computerized Dynamic Posturography and Vestibular Function Test.
