Testing for Vitamin D Deficiency

Vitamin D is found in several dietary sources such as fish, eggs, fortified milk, and cod liver oil. The sun also contributes significantly to the daily production of vitamin D, and as little as 10 minutes of exposure is thought to be enough to prevent deficiencies. The term "vitamin D" refers to several different forms of this vitamin. Two forms are important in humans: ergocalciferol (vitamin D-2) and cholecalciferol (vitamin D-3). Vitamin D-2 is synthesized by plants. Vitamin D-3 is synthesized by humans in the skin when it is exposed to ultraviolet-B (UVB) rays from sunlight. Foods may be fortified with vitamin D-2 or D-3. The major biologic function of vitamin D is to maintain normal blood levels of calcium and phosphorus.
Rickets and osteomalacia are classic vitamin D deficiency diseases. In children, vitamin D deficiency causes rickets, which results in skeletal deformities. In adults, vitamin D deficiency can lead to osteomalacia, which results in muscular weakness in addition to weak bones.

According to the American College of Physician's ACP Internist, Vitamin D assays are expensive and can be inaccurate. Rather than testing for Vitamin D deficiency, take a history regarding diet and sun exposure or assume Vitamin D deficiency and treat accordingly with recommended daily supplementation.

**Institute of Medicine Report (IOM)**
A 2010 IOM report updated guidance on vitamin D and calcium.

The committee reviewed data for more than 1,000 studies and heard testimony from numerous investigators. They noted that there has been a large and unnecessary increase in the number of tests for vitamin D levels in recent years. Vitamin D testing should not be part of routine medical care.

The panel's findings confirmed the benefits of calcium and vitamin D related to bone health. However, reviews of about two dozen other health outcomes—including cancer, cardiovascular disease, hypertension and diabetes—found insufficient and sometimes conflicting data regarding the nutrients' benefits. Solid evidence could not be found that consuming more of either nutrient would protect from chronic diseases ranging from cancer to diabetes to improved immune function.

**Endocrine Society**
The Endocrine Society has published new practice guidelines that recommend against routinely measuring serum vitamin D levels.

Screening is recommended for those at high risk for deficiency including those with osteoporosis, obesity, or history of falls.

Vitamin D deficiency is defined as serum 25-hydroxyvitamin D level less than 20 ng / ml. Serum assays are notoriously variable.

Recommended dietary intake for children and adults is at least 600 IU daily (800 IU for those age greater than 70). Some at risk adults might require 1500 IU.

Treatment of vitamin D deficiency is indicated mainly for skeletal reasons; evidence also suggests that treatment lowers the incidence of falls in older adults.
**POLICY**

A. Testing for Vitamin D deficiency is considered **not medically necessary** except when:
   1. The recommended vitamin D supplementation is being taken **AND**
   2. One of the following conditions is present:
      a. chronic kidney disease
      b. granulomatous disorder
      c. hyperthyroidism
      d. hyperparathyroidism
      e. heritable disorders of Vitamin D metabolism
      f. liver failure
      g. malabsorption
      h. medications (anti-convulsants, glucocorticoids, oral anti-fungals, AIDS medications)
      i. obesity
      j. osteomalacia
      k. osteopenia
      l. osteoporosis
      m. phosphaturia
      n. rickets
      o. muscle weakness
      p. history of falls
      q. history of vitamin D deficiency
      r. post transplant

B. Routine screening for vitamin D deficiency is **not medically necessary**.

**CODING**

The following codes for treatment and procedures applicable to this policy are included below for informational purposes. Inclusion or exclusion of a procedure, diagnosis or device code(s) does not constitute or imply member coverage or provider reimbursement. Please refer to the member’s contract benefits in effect at the time of service to determine coverage or non-coverage of these services as it applies to an individual member.

In Policy section:
- To emphasize the need for recommended vitamin D supplementation prior to testing, revised the wording from:
  "A. Conditions for which testing for vitamin D deficiency may be considered medically necessary, include:"
to:
  "A. Testing for vitamin D deficiency is considered not medically necessary except when:
  1. The recommended vitamin D supplementation is being taken AND
  2. One of the following conditions is present:"

In Coding section:
- Updated diagnosis coding from 345.0-345.9 to 345.00-345.91

01-28-11
Updated Description section.
Updated Reference section.

In Coding section:
- Addition of diagnosis codes: 252.1 and 775.4.

03-28-2011
In Coding section:
- Removed Diagnosis code 268.9.
Updated Reference section

09-29-2011
Updated the Description section.
In the Policy Language section:
- In Item A, #2, h, added "oral anti-fungals,"
- In Item A, #2, added the following:
  o “p. muscle weakness
  o p. history of falls
  o q. history of vitamin D deficiency”
In the Coding section:
- Added the following diagnosis codes: 135, 263-263.8, 268.9, 275.41, 275.49, 555.0-555.9, 556.0, 556.1, 556.2, 556.3, 556.6, 556.8, 556.9, 577.1, 579.0-579.9, 728.87
Updated the Reference section.

12-20-2011
In the Coding Section:
- Added the following diagnosis codes: 277.00, 277.02, 277.03, 277.9

02-05-2014
Policy reviewed.

In Policy section:
- In Item A, 2, inserted "r. Post transplant"

In Coding section:
- Added ICD-10 Diagnosis (Effective October 1, 2014)
